**APPLICATION FOR
UNITED STATES LETTERS PATENT**

S P E C I F I C A T I O N

TO ALL WHOM IT MAY CONCERN:

Be it known that we, Keun Kyu KONG, a citizen of the Republic of Korea, residing at #104-901 Godam Dormitory, 72-1 Godam-dong, Ichon-dhi, Kyoungki-do 467-140, Republic of Korea, and Gyu Dong PARK, a citizen of the Republic of Korea, residing at #106-1504 Hyundai Apt., 441-1 Sadong-ri, Daewol-myeon, Ichon-shi, Kyoungki-do 457-850, Republic of Korea, and Jae Chang JUNG, a citizen of the Republic of Korea, residing at #107-1304 Hyundai Apt., Sadong-ri, Daewol-myeon, Ichon-shi, Kyoungki-do 467-850, Republic of Korea, and Ki Soo SHIN, a citizen of the Republic of Korea, residing at #101-503 Dongbu-Haeohreum Apt., Yoksam-dong, Gangnam-gu, Seoul 135-080, Republic of Korea, have invented a new and useful **PATTERN WIDTH SLIMMING-INHIBITING METHOD OF PHOTORESIST PATTERN USING PHOTORESIST COMPOSITION CONTAINING THERMAL ACID GENERATOR**, of which the following is a specification.

**PATTERN WIDTH SLIMMING-INHIBITING METHOD OF
PHOTORESIST PATTERN USING PHOTORESIST COMPOSITION
CONTAINING THERMAL ACID GENERATOR**

5

BACKGROUND

Technical Field

A method for inhibiting pattern width slimming or reduction of photoresists is disclosed. In particular, a method for inhibiting pattern width slimming due to the beam emitted by a scanning electron microscope (hereinafter, it is abbreviated to "SEM") while measuring a critical dimension (hereinafter, it is abbreviated to "CD") of a photoresist pattern obtained by using a photoresist composition comprising thermal acid generator is disclosed.

15 Description of the Prior Art

Typically, the semiconductor processing is carried out by setting up a CD target and the SEM measures the CD when a photoresist pattern is formed. When the CD is measured immediately after a pattern is formed, the CD is almost identical with a target. However, thirty seconds after the CD measurement by the SEM, that is, 20 during the observation by the SEM, width of the pattern gets slimmed. The basic mechanism of the SEM is that image is seen through e-beam projected under high vacuum. Most of the ArF photoresist gets cracked due to e-beam and at that time, the cracked parts are disappeared due to high vacuum, which consequently slims pattern width. Therefore, there were many problems in establishing the CD target during a 25 semiconductor processing because measuring the CD itself is very difficult.

SUMMARY OF THE DISCLOSURE

A method for preventing a photoresist pattern from being slimming while measuring its CD using SEM is disclosed by forming the photoresist pattern using a 30 photoresist composition containing a thermal acid generator and additionally heating the formed photoresist pattern after developing step.

BRIEF DESCRIPTION OF THE DRAWINGS

Figure 1A is a photograph of a photoresist pattern obtained according to a conventional method that is taken immediately after the CD measurement using a SEM.

5 Figure 1B is a photograph of a photoresist pattern obtained according to the conventional method that is taken after approximately thirty seconds since the CD measurement using the SEM.

Figure 2A is a photograph of a photoresist pattern obtained according to the present invention that is taken immediately after the CD measurement using the SEM.

10 Figure 2B is a photograph of a photoresist pattern obtained according to the present invention that is taken after approximately thirty seconds since the CD measurement using the SEM.

DETAILED DESCRIPTION OF THE

PRESENTLY PREFERRED EMBODIMENTS

A process for producing a photoresist pattern according to the present invention includes the steps of:

(a) coating a photoresist composition containing a thermal acid generator on a substrate to form a photoresist film;

20 (b) exposing the photoresist film;

 (c) developing the exposed photoresist film to obtain a photoresist pattern;

and

 (d) heating the photoresist pattern.

The photoresist composition includes a thermal acid generator, chemically amplified photoresist resin, a photoacid generator and organic solvent.

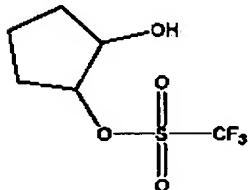

Exemplary thermal acid generator is alcohol having a leaving group, preferably a cyclic alcohol whose ortho-position is substituted with the leaving group. It has been found by the inventors that a sulfonate group is particularly useful as the leaving group.

30 Some of preferred thermal acid generators are disclosed, but are not limited to, as following Formulas 1 to 4:

Formula 1

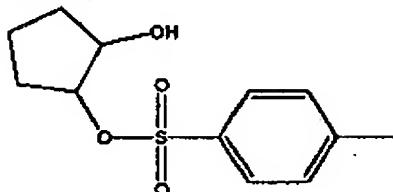

Formula 2

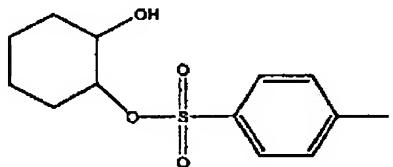

5

Formula 3

Formula 4

The thermal acid generator is generally used in an amount ranging from
10 about 0.1 to about 5 wt% based on that of the photoresist resin employed.

The photoresist resin of the photoresist composition can be any currently known chemically amplified photoresist polymer disclosed in US 5,212,043 (May 18, 1993), WO 97/33198 (Sep 12, 1997), WO 96/37526 (Nov 28, 1996), EP 0 794 458 (Sep 10, 1997), EP 0 789 278 (Aug 13, 1997) and US 6,132,926 (Oct 17, 2000).

15 As for the chemically amplified photoresist resin of the present invention, cyclo olefin repeating unit having hydroxyalkyl functional group is employed in order to form a cross-linking bond and to improve adhesiveness to the substrate. And cyclo olefin repeating unit having carboxyl functional group or maleic anhydride repeating unit can be further included in the photoresist resin.

20 It is preferable the photoresist polymer is prepared by radical additional polymerization of cycloolefin repeating units and the ring structures of the cycloolefin repeating units remains in the main chain of the polymer.

More preferred photoresist polymer is poly(tert-butyl bicyclo[2.2.1]hept-5-ene-2-carboxylate / 2-hydroxyethyl bicyclo[2.2.1]hept-5-ene-2-carboxylate / bicyclo[2.2.1]hept-5-ene-2-carboxylic acid / maleic anhydride).

In addition, the photoresist resin should not flow at about 150°C or higher, the
5 point where the thermal acid generator begins to release an acid.

Any of conventional photoacid generator, which is able to generate acids when it is exposed to light, can be used. Some of them are disclosed in US 5,212,043 (May 18, 1993), WO 97/33198 (Sep 12, 1997), WO 96/37526 (Nov 28, 1996), EP 0 794 458 (Sep 10, 1997), EP 0789 278 (Aug 13, 1997) and US 6,132,926 (Oct 17, 2000).

10 Preferred photoacid generators have a relatively low light absorbency in the wavelengths of 157 nm and 193 nm. More preferably, the photoacid generator is diphenyl iodide hexafluorophosphate, diphenyl iodide hexafluoroarsenate, diphenyl iodide hexafluoroantimonate, diphenyl p-methoxyphenyl triflate, diphenyl p-toluenyl triflate, diphenyl p-isobutylphenyl triflate, triphenylsulfonium hexafluoroarsenate,
15 triphenylsulfonium hexafluoroantimonate, triphenylsulfonium triflate, dibutynaphthylsulfonium triflate, phthalimidotrifluoromethane sulfonate, dinitrobenzyltosylate, n-decyl disulfone, naphthylimido trifluoromethane sulfonate or mixture thereof.

The photoacid generator is used in an amount ranging from about 0.1 to about
20 10% by weight of the photoresist polymer employed. It has been found that when the photoacid generator is used in the amount less than about 0.1%, it lowers photosensitivity of the photoresist composition, and when the photoacid generator is used in the amount greater than about 10%, it results in a poor pattern formation due to its high absorption.

25 On the other hand, any of conventional organic solvent can be employed for this invention and some of them are disclosed in US 5,212,043 (May 18, 1993), WO 97/33198 (Sep 12, 1997), WO 96/37526 (Nov 28, 1996), EP 0 794 458 (Sep 10, 1997), EP 0789 278 (Aug 13, 1997) and US 6,132,926 (Oct 17, 2000).

Preferred organic solvent for photoresist composition is diethyleneglycol
30 diethyl ether, methyl 3-methoxypropionate, ethyl 3-ethoxypriopionate, propyleneglycol methyl ether acetate, ethyl lactate, cyclohexanone, 2-heptanone or mixture thereof.

The amount of solvent used is preferably in an amount ranging from about 100 to about 2000 wt% of the photoresist resin employed in order to obtain a photoresist film having intended thickness.

Exemplary light sources which are useful for forming the photoresist pattern 5 include, EUV (Extreme Ultra Violet), VUV (Vacuum Ultra Violet; 157nm), ArF(193nm), KrF(248nm), E-beam, X-ray or ion beam.

The process for forming the photoresist pattern can further include a soft baking which is performed before the step (b) and/or a post baking which is 10 performed after the step (b). Preferably, the soft and post baking steps are performed at temperature of around 110°C. As long as the temperature does not exceed 150°C, no acid is generated from the thermal acid generator during the soft baking or post baking process.

Preferably, the heating step (d) is carried out at a temperature higher than 150°C, where a thermal acid generator begins to release an acid, and more preferably, 15 at a temperature range from about 150 to about 250°C.

In contrast to the conventional method for forming a photoresist pattern, an additional step of heating the formed pattern is carried out, in which acid is generated by a thermal acid generator. The produced acid catalyzes cross-linking reaction, between hydroxyl group and carboxyl group; hydroxyl group and maleic anhydride; 20 or carboxyl group and maleic anhydride in photoresist resins.

Another embodiment provides a semiconductor element that is manufactured using the photoresist composition described above.

The disclosed methods will now be described in more detail by referring to the examples below, which are not intended to be limiting.

25 Comparative Example

To 7.2g of PGMEA (propylene glycol methyl ether acetate) solvent was added 1g of poly(tert-butyl bicyclo[2.2.1]hept-5-ene-2-carboxylate / 2-hydroxyethyl bicyclo[2.2.1]hept-5-ene-2-carboxylate / bicyclo[2.2.1]hept-5-ene-2-carboxylic acid / maleic anhydride) and 0.012g of triphenylsulfonium triflate, and the resultant was 30 filtered to obtain a photoresist composition. The photoresist composition was coated on the silicon wafer, baked at 110 °C for 90 seconds and exposed to light using ArF laser exposing device. The photoresist composition was post-baked at 110 °C for 90 seconds, and developed in 2.38 wt% aqueous TMAH solution to obtain a 138nm L/S

pattern right after measuring the CD of the pattern using the SEM (see Fig. 1A). Thirty seconds after the measurement by the SEM, the pattern was slimmed by 26nm, that is the pattern became 112nm L/S pattern (see Fig. 1B).

Invention Example

5 To 7.2g of PGMEA (propylene glycol methyl ether acetate) solvent was added 1g of poly(tert-butyl bicyclo[2.2.1]hept-5-ene-2-carboxylate / 2-hydroxyethyl bicyclo[2.2.1]hept-5-ene-2-carboxylate / bicyclo[2.2.1]hept-5-ene-2-carboxylic acid / maleic anhydride), 0.012g of triphenylsulfonium triflate, and 0.02g of a thermal acid generator of Formula 2; and the resultant was filtered to obtain a photoresist composition.

10 The photoresist composition was coated on the silicon wafer, baked at 110 °C for 90 seconds and exposed to light using ArF laser exposing device. The photoresist composition was post-baked at 110 °C for 90 seconds, and developed in 2.38 wt% aqueous TMAH solution to obtain a 138nm L/S pattern right after measuring the CD of the pattern using the SEM (see Fig. 2A). The formed pattern

15 was heated at 175 °C for 60 seconds and the CD was measured by using the SEM. At this time, no slimming occurred and 138nm L/S pattern was maintained (see Fig. 2B).

As described above, according to the conventional method, the CD measurement using the SEM during a semiconductor processing was almost impossible due to the slimmed pattern as much as 26nm. However, according to the present invention, the pattern after the CD measurement did not get slimmed, thus a semiconductor processing was proceeded regardless of the CD measurement.

Therefore, when a photoresist composition containing a thermal acid generator is employed for a photoresist pattern forming process and additionally the resultant pattern is heated after developing step, a cross-linking reaction occurs to patterning photoresist compositions, and the SEM-beam has no effect on the patterns, which consequently makes it easy to set up the CD target during the semiconductor process.

The foregoing discussion has been presented for purposes of illustration and description. The foregoing is not intended to limit the disclosure to the form or forms disclosed herein. Although the description of the disclosed methods has included 30 description of one or more embodiments and certain variations and modifications, other variations and modifications are within the scope of the disclosure, *e.g.*, as may be within the skill and knowledge of those in the art, after understanding the present disclosure. It is intended to obtain rights which include alternative embodiments to

the extent permitted, including alternate, interchangeable and/or equivalent structures, functions, ranges or steps to those claimed, whether or not such alternate, interchangeable and/or equivalent structures, functions, ranges or steps are disclosed herein, and without intending to publicly dedicate any patentable subject matter.
